

MUNICIPAL REAL ESTATE MARKET INSIGHTS Comprehensive Real Estate Sales Analysis (2011–2022)

SLIDE 1: MACRO TRENDS & MARKET VOLATILITY

- Historical Valuation Apex: The market reached its historic peak in late 2021, with average sales price records spiking sharply to over \$1.36M.
- Volume-Price Catalyst: Transaction volume peaked in mid-2021, acting as the demand shock that directly triggered the subsequent price explosion.
- Monetary Correction: Valuations underwent a sharp downward correction through 2022, stabilizing near a \$500K baseline floor by early 2023.
- Predictable Cyclicity: The timeline exposes intense annual seasonal valleys in registration volume before fully recovering in subsequent quarters.

SLIDE 2: GEOGRAPHIC REVENUE CONCENTRATIONS

- Capital Concentration Apex: Real estate capital is heavily polarized; a single municipality—Hot Springs, Arkansas—dominates with a massive \$8.61B in total volume.
- Severe Regional Disparity: While secondary hubs like Rehoboth Beach (\$4.25B) and Asheville (\$4.13B) show robust activity, investment rates drop off rapidly outside premium zones.
- Custom Data Profiling: The Property Type filter uses a specialized multi-value selection to isolate verified classes while stripping out administrative noise.

SLIDE 3: HOUSING SUPPLY & STRUCTURAL MIX

- Total Residential Monopoly: Isolating core housing frameworks exposes a massive structural mono-culture, with Residential assets monopolizing 99.02% of active inventory.
- Assessed Value Corridor: Toggling the metric panel to Assessed Value reveals a tightly regulated government appraisal band locked strictly between \$237,612 and \$333,182.
- Regulated Value Stability: Municipal assessed values avoided volatile open-market pricing spikes, holding highly flat across the decade before adjusting to a high of \$478.3K in 2022.

SLIDE 4: POLICY & ASSESSMENT REVISIONS

- Severe Appraisal Disparities: The matrix exposes severe tax inequities where ratios run well over the 1.00 parity line—notably Kearney (2.38) and Tuscaloosa (2.28) under Four Family.
- Taxation Revenue Leakage: Significant revenue leaks occur where condo ratios drop far below target parity, particularly in Salina (0.71) and Beaufort (0.72).

- Regressive Valuation Anomaly: High-density multifamily structures bear a disproportionate tax burden; however, deep volatility exists as Columbia breaks trends with an over-assessed Single Family ratio of 1.29.
- Zoning Policy Directive: Recommend immediate structural adjustment of appraisal models to pull outlier ratios back toward 1.00, equalizing liabilities to incentivize affordable housing production.
